

Can I Install SoftLINK Silently Without Restarting the Workstation?

Summary

There are many occasions when you do not want to force a restart of a workstation after installing an application silently, especially if you are installing multiple applications at one time.

Details

To do a silent installation of SoftLINK without restarting you will need to edit the NSS.ini.

The line that must be added to the NSS.ini file is:

RESTART=

Making this change to the ini file will allow you to do the silent install without restarting the machine.
